Right to work: Stamp 1G (pending): full-time for 24 months, no sponsorship needed; Critical Skills permit eligible after

PROFILE

Backend developer with six years in fintech and payments. Most recently at T05 Technologies, where I looked after the core payment platform behind all of the company's products (5 payment gateways), helped build its replacement, and built Node.js and MongoDB backends running on Kubernetes. Before that, two and a half years in Hitachi's database team tracking down slow production queries. I've just finished an MSc in Project Management at UCD Smurfit and I'm looking for a backend role in Dublin.

TECHNICAL SKILLS

- **Backend:** Node.js, JavaScript, Express, Mongoose, REST APIs, payment gateway integration, EMV QR payments, WebSockets, MQTT, Java, C#, .NET, SQL
- **Databases:** MongoDB (aggregation pipelines, indexing), PostgreSQL, MySQL, Oracle PL/SQL, query optimisation
- **Testing:** API testing (Postman), ZOMBIES approach for edge cases
- **DevOps & Cloud:** Kubernetes, Docker, CI/CD, GitHub Actions, Jenkins (basic), GitLab, Git, Azure, AWS (familiar)
- **Ways of working:** Agile/Scrum, code review, production support, incident handling, root-cause analysis

EDUCATION

- **MSc Project Management**, 2:1 (GPA 3.56), University College Dublin, Michael Smurfit Graduate Business School, 2025 – 2026
- **BEng (Hons) Software Engineering**, 2:1, Sheffield Hallam University, UK, 2015 – 2018

EXPERIENCE

Software Developer, Backend Development **Jan 2023 – Jul 2025**

T05 Technologies, Selangor, Malaysia

- Took over T05Pay, the company's core payment platform. The founders built it about ten years earlier, and every T05 product took payments through it, across 5 payment gateways.
- Kept T05Pay running and improving: fixed bugs, extended features, cleared up long-standing conflicting errors, and agreed payload and API changes with the frontend developer. Added 3 of its 5 payment gateway integrations myself, and built its EMV QR payment flow with encrypted data transfer.
- Built the backends for three products that ran their payments through T05Pay: MARS (employee rewards and vending-machine redemptions), 1SEA (a super app) and NIoTMS (IoT machine management), in Node.js, Express and MongoDB.
- MongoDB with Mongoose was the database for everything at T05. I wrote aggregation pipelines (for example, working out each MARS member's remaining credit and expiring old credit), added compound indexes for slow queries, and used Mongoose virtuals for computed fields.
- One of three developers who built Payrallel, T05Pay's replacement. T05Pay's dependencies were too old to upgrade without breaking it, so we rebuilt on current Node.js, Express and Mongoose with proper development SOPs. Payrallel is now live and T05Pay has been retired.
- On Payrallel I built the payment gateway integrations and the connections to MARS, 1SEA and NIoTMS, and rebuilt the EMV QR flow end to end: generating and showing the QR, polling the gateway and handling its callbacks, updating payment status, voiding payments that timed out, and notifying the other systems.
- Tested my own changes in Postman before each release, using the ZOMBIES approach to cover empty, single, many, boundary and error cases.
- Looked after our Kubernetes setup in production: checking the nodes, fixing them when they went down, and handling restarts during releases. Wrote shell scripts for the commands I ran every day and handed them over when I left.

Associate Technical Service Engineer, Database **Aug 2020 – Dec 2022**

Hitachi eBworx, Selangor, Malaysia

- Part of the internal database team that found and fixed slow or resource-heavy queries in Oracle PL/SQL and MySQL across client environments.
- Most fixes were small gains; the biggest took a critical script from about 5 minutes to under 1.
- Production-blocking problems came first; everything else went into an optimisation backlog.

- Kept the team's benchmarking scripts (query time, CPU, memory, uptime) working and added to them.

Application Engineer, Banking Applications **Mar 2019 – Aug 2020**
Hitachi eBworx, *Selangor*, *Malaysia*

- Worked on credit management software for a Tier-2 bank, shipping UI and backend changes in sprints.
- Investigated API and configuration issues the client raised and fixed the underlying causes.
- Took releases from UAT into production and coordinated the go-lives, onsite and remotely.

PROJECTS

- **MARS (2024):** lets companies give staff a monthly allowance to spend at office vending machines. Node.js backend with real-time transaction monitoring and campaign management; e-wallet top-ups, NFC card and code redemptions all go through T05Pay. 200–300 users when I left, now over 500.
- **1SEA (2024):** a super app. Led the API work that let third-party mini-apps share one login, and worked directly with the external developer to get it connected.
- **NIoTMS (2023):** remote monitoring and control for unattended machines over MQTT, with payment and sales tracking built in.
